

Portals & Content Management

The ability to access and share a wide variety of content is critically important to high performance. A successful portal and content management infrastructure dynamically aggregates content and applications to provide different types of user's self-service access to the information they need.

Organizations need to govern, view, manage and store all types of data as a seamless whole. Our approach to information management therefore takes into consideration the need to manage not only structured but unstructured data for an enterprise-wide solution. Our Portal Services involve the following steps:

- Define business cases and formulate e-enabling strategies;
- Evaluate technologies and platforms and suggest optimal solutions;
- Audit existing e-enabling systems and provide consolidation strategies;
- Perform cost-benefit and ROI analysis;
- Generate architecture blueprints;
- Provide an implementation road map;
- Establish detailed project plan, scope and budget;
- Perform web application tuning & scalability services.
